Kerk Gerald Quinamot

Good questions. Thorough testing.

Senior QA Engineer

I turn requirements into test coverage, investigate what happens in the product, and make release risks clear. My work combines hands-on web and mobile testing with AI-assisted automation.

QA since 2014 / Web, iOS and Android

Start with the risk.

Prioritize important journeys, changed behavior, and edge cases. Clarify uncertainty before treating it as an expected result.

In practice: clarifying chat behavior. I created an AI-assisted QA review workflow to cross-check acceptance criteria against Figma designs and surface missing scenarios before test-case generation. Areas of ambiguity included deactivated or deleted accounts and image/file attachments in chat. The workflow was designed to flag discrepancies and suggest edge cases for review, rather than turn assumptions into expected behavior.

Follow the behavior.

Use exploratory and regression testing, API checks, defect investigation, and fix verification to understand what the product actually does.

Connect cases, scripts and results.

Review automation candidates and AI-assisted scripts. Check whether assertions match the test intent, then explain what the execution evidence establishes.

THREE WAYS TO EXPLORE MY WORK

The work, and my contribution.

01 / QA DEMONSTRATION - FICTIONAL SCENARIO

Test design walkthrough

A profile edit becomes a five-stage walkthrough: requirement, questions and risk priorities, test cases, an automation candidate, and expected checks and reporting.

What it shows: boundary selection, protection of saved data, and decisions to clarify before testing. The reconstructed Playwright test illustrates setup, rejection checks, and persistence assertions.

Prepared with AI assistance for the portfolio. No client execution results are claimed.

Explore the test design walkthrough

02 / REVIEWED WORK - PLAYWRIGHT + TYPESCRIPT

A web case traced to its result

My contribution: QA direction, case and script review, and hands-on testing. AI assisted script preparation.

Saved result: The matching saved result records Pass for this case. The reviewed sign-in visibility case connects to its BDD scenario and TypeScript assertions.

Historical evidence for one visibility case; it does not verify authentication, the current build, or the whole suite. My role does not imply sole framework authorship.

Explore the Playwright case

03 / REVIEWED WORK - MAESTRO

Reviewing the assertion behind a pass

My contribution: QA direction, automation-candidate and script review, and hands-on validation. AI assisted script preparation.

Saved result: The saved Android retry passes its navigation checks, but those checks do not directly verify that the button is disabled.

The full disabled-button expected result remains unverified on Android. An iOS assertion was inspected, but a matching iOS execution was not reviewed. No current-build or cross-platform pass is claimed.

HOW I WORK

AI assists.
QA judgment stays with me.

I use Claude and ChatGPT/Codex for test preparation and script drafting, and sometimes Gemini for report audits or drafting. I give them requirements, platform scope, expected checks, and a defined output.

I review coverage, assumptions, automation candidates, and assertions; validate hands-on; and retain the connection between a case, its script, and its result. The examples distinguish my QA contribution from AI-assisted preparation.

Tools in context

Playwright, TypeScript, and Maestro for the selected automation examples.
Bruno, Postman, Figma, ClickUp, Qase, and Git across testing and review.

Professional background

Experience	QA professional - 2014-present
Certification	Certified Tester Foundation Level (CTFL) - 2020
Education	Bachelor of Science, Information Technology - 2013
Earlier role	Guest Lecturer - 2013-2014

Let's talk testing.
